

Premium Food Intolerance Test

Why is it important for your patient to take the test?

When food particles enter the bloodstream, your immune system can sometimes identify these food proteins as 'foreign' and produces IgG antibodies to 'attack' the particular food in question.

This response is their immune system's natural defence mechanism to ward off harmful invaders in the body which can create inflammation. This inflammation can then trigger troublesome symptoms, which may persist if they are neglected.

With support, people suffering from these types of symptoms have told us that they have been helped by the Premium Food Intolerance* test:

- Headaches
- Bloating
- Wind
- Abdominal pain
- Lethargy
- Tiredness
- Anxiety
- Weight gain
- Diarrhoea
- Skin problems, like eczema, psoriasis, rashes, itchy skin & hives
